

Each one of those shown is a challenge for me, it is 6 months of discipline, constant effort and learning to which I have to devote the maximum effort. One of the most notable was the **Plan Often** ... although programming is not mechanical, I need a plan that helps me understand and solve problems more easily and quickly. I think that's how I'll get to the perfect solution. First I will see that the codes have not been made in the most efficient way possible, but that everything takes time, that today a solution will have 50 lines of code, but tomorrow it can go down to 20. But I want to arrive at a plan that when I have a Problem knows where to start and what works in all cases.
